Add 10 g of powdered potassium sulphate and a few crystals of copper sulphate Add 30 ml of concentrated Sulphuric acid to the flask. Place the flask in an inclined position. Heat below the boiling point until fuming ceases. Raise the temperature to bring the acid to brisk boiling. Continue the heating until the solution becomes straw-yellow in colour for practically water-white. Now remove the flask from the flame and cool. Transfer quantitatively to the round bottom flask and dilute to about 250 ml with water.

C-3.2 Add about 60 ml or more, if necessary, to make the solution alkaline of sodium hydroxide solution carefully down the side of the flask so that it does not mix at one with the acid solution but forms a layer below it. Assemble the apparatus with the tip of the condenser dipping in a known quantity of standard Sulphuric acid in excess that required to neutralize the ammonia to be evolved beaker to which a few drops of mixed indicator have been added. Mix the contents of the flask by shaking and distill until all ammonia has passed over. Detach flask from the condenser and shutoff the burner. Rinse the

condenser thoroughly with water into the beaker. Wash, the dip tube carefully so that all traces of the condenser are transfer to the beaker. When all the washings have drained into the beaker, add two a three drops more of the indicator and titrate with standard sodium hydroxide solution.

C-3.3 Carry out a blank using all reagents in the same quantities without the materials to be tested.

APPENDIX – D

2 (d). BIURET CONTENT OF UREA COLORIMETRIC METHOD:

D-1.0 Summary of Method:

A known weight of sample is stirred in a CO₂ -free distilled water to dissolve the biuret and the solution is filtered. The filtrate is passed through an ion exchange column to remove interferences such as ammonium ions. The eluate is then treated with copper sulphate in the presence of alkaline tartrate solution, the biuret in the sample reacts to form a copper complex, the intensity of which is proportional to the biuret content. The colour intensity is measured at 550 μ and with the absorbance known, the percent biuret is determined from the calibration curve. Results are reported to the nearest 0.01 weight percent.

D-2.0 Apparatus

D-2.1 **Spectrophotometer** - Capable of measuring absorbance at 555 nm, and wash the Beckman DU instrument, photoelectric colorimeters fitted with a 500 – 570 m (or 520 580 m) filter are acceptable.
